

NAME: Atharva Chavan
TE-A IT
ROLL NO: T1851010
PRN: 71901316L

Group C: MongoDB

Assignment No. 12

AIM: Create a database with suitable example using MongoDB and implement

- Inserting and saving document (batch insert, insertvalidation)
- Removingdocument
- Updating document (document replacement, using modifiers, upserts,updating multiple documents, returning updateddocuments)

THEORY:

MongoDB

MongoDB is an open-source document database and leading NoSQL database.

Database

Database is a physical container for collections. Each database gets its own set of files on the file system. A single MongoDB server typically has multiple databases.

Collection

Collection is a group of MongoDB documents. It is the equivalent of an RDBMS table. A collection exists within a single database. Collections do not enforce a schema. Documents within a collection can have different fields. Typically, all documents in a collection are of similar or related purpose.

Document

A document is a set of key-value pairs. Documents have dynamic schema. Dynamic schema means that documents in the same collection do not need to have the same set of fields or structure, and common fields in a collection's documents may hold different types of data.

The following table shows the relationship of RDBMS terminology with MongoDB.

RDBMS	MongoDB
Database	Database
Table	Collection
Tuple/Row	Document
column	Field
Table Join	Embedded Documents
Primary Key	Primary Key (Default key _id provided by mongodb itself)

Advantages of MongoDB over RDBMS

- **Schema less** – MongoDB is a document database in which one collection holds different documents. Number of fields, content and size of the document can differ from one document to another.
- Structure of a single object is clear.
- No complex joins.
- Deep query-ability. MongoDB supports dynamic queries on documents using a document-based query language that's nearly as powerful as SQL.
- Tuning.
- **Ease of scale-out** – MongoDB is easy to scale.
- Conversion/mapping of application objects to database objects not needed.
- Uses internal memory for storing the (windowed) working set, enabling faster access of data.

Why Use MongoDB?

- **Document Oriented Storage** – Data is stored in the form of JSON styled documents.
- Index on any attribute
- Replication and high availability
- Auto-sharding
- Rich queries
- Fast in-place updates
- Professional support by

MongoDB Where to Use MongoDB?

- Big Data
- Content Management and Delivery
- Mobile and Social Infrastructure
- User Data Management
- Data Hub

The use Command

MongoDB **use DATABASE_NAME** is used to create database. The command will create a new database if it doesn't exist, otherwise it will return the existing database.

Syntax

```
use DATABASE_NAME
```

Example

```
>use mydb  
switched todbmydb
```

To check your currently selected database, use the command **db**

```
>db  
mydb
```

If you want to check your databases list, use the command **show dbs**.

```
>show dbs  
local    0.78125GB  
test     0.23012GB
```

Your created database (mydb) is not present in list. To display database, you need to insert at least one document into it.

The dropDatabase() Method

MongoDB **db.dropDatabase()** command is used to drop a existing database.

Syntax

```
db.dropDatabase()
```

This will delete the selected database. If you have not selected any database, then it will delete default 'test' database.

Example

First, check the list of available databases by using the command, **show dbs**.

```
>show dbs  
local0.78125GB  
mydb0.23012GB  
test0.23012GB  
>
```

If you want to delete new database **<mydb>**, then **dropDatabase()** command would be as follows –

```
>use mydb  
switched todbmydb  
>db.dropDatabase()  
>{ "dropped":"mydb","ok":1 }
```

```
>show dbs
local0.78125GB
test0.23012GB
>
```

The createCollection() Method

MongoDB **db.createCollection(name, options)** is used to create collection.

Syntax

```
db.createCollection(name, options)
```

Examples

```
>use test
switched to db test
>db.createCollection("mycollection")
{"ok":1}
>
```

You can check the created collection by using the command **show collections**.

```
>show collections
mycollection
system.indexes
```

The drop() Method

MongoDB's **db.collection.drop()** is used to drop a collection from the database.

Syntax

Basic syntax of **drop()** command is as follows –

```
db.COLLECTION_NAME.drop()
```

The insert() Method

To insert data into MongoDB collection, you need to use MongoDB's **insert()** or **save()** method.

Syntax

The basic syntax of **insert()** command is as follows –

```
>db.COLLECTION_NAME.insert(document)
```

Example

```
>db.mycol.insert({
  _id:ObjectId("7df78ad8902c"),
  title:'MongoDB Overview',
```

```
description:'MongoDB is no sql database',
by:'tutorials point',
url:'http://www.tutorialspoint.com',
tags:['mongodb','database','NoSQL'],
likes:100
})
```

Here **mycol** is our collection name, as created in the previous chapter. If the collection doesn't exist in the database, then MongoDB will create this collection and then insert a document into it.

In the inserted document, if we don't specify the `_id` parameter, then MongoDB assigns a unique ObjectId for this document.

`_id` is 12 bytes hexadecimal number unique for every document in a collection. 12 bytes are divided as follows –

```
_id: ObjectId(4 bytes timestamp, 3 bytes machine id, 2 bytes process id,
3 bytes incrementer)
```

To insert multiple documents in a single query, you can pass an array of documents in `insert()` command.

Example

```
>db.post.insert([
{
title:'MongoDB Overview',
description:'MongoDB is no sql database',
by:'tutorials point',
url:'http://www.tutorialspoint.com',
tags:['mongodb','database','NoSQL'],
likes:100
},

{
title:'NoSQL Database',
description:"NoSQL database doesn't have tables",
by:'tutorials point',
url:'http://www.tutorialspoint.com',
tags:['mongodb','database','NoSQL'],
likes:20,
comments:[
{
user:'user1',
message:'My first comment',
dateCreated:new Date(2013,11,10,2,35),
like:0
}
]
}
```

```
]
}
D)
```

The find() Method

To query data from MongoDB collection, you need to use MongoDB's **find()** method.

Syntax

The basic syntax of **find()** method is as follows –

```
>db.COLLECTION_NAME.find()
```

find() method will display all the documents in a non-structured way.

The pretty() Method

To display the results in a formatted way, you can use **pretty()** method.

Syntax

```
>db.mycol.find().pretty()
```

MongoDBUpdate() Method

The update() method updates the values in the existing document.

Syntax

The basic syntax of **update()** method is as follows –

```
>db.COLLECTION_NAME.update(SELECTION_CRITERIA, UPDATED_DATA)
```

Example

Consider the mycol collection has the following data.

```
{"_id":ObjectId(5983548781331adf45ec5),"title":"MongoDB Overview"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

Following example will set the new title 'New MongoDB Tutorial' of the documents whose title is 'MongoDB Overview'.

```
>db.mycol.update({'title':'MongoDB Overview'},{$set:{'title':'NewMongoDB Tutorial'}})
>db.mycol.find()
{"_id":ObjectId(5983548781331adf45ec5),"title":"NewMongoDB Tutorial"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
>
```

By default, MongoDB will update only a single document. To update multiple documents, you need to set a parameter 'multi' to true.

```
>db.mycol.update({'title':'MongoDB Overview'},
{$set: {'title':'NewMongoDB Tutorial'}},{multi:true})
```

MongoDBSave() Method

The **save()** method replaces the existing document with the new document passed in the save() method.

Syntax

The basic syntax of MongoDB **save()** method is shown below –

```
>db.COLLECTION_NAME.save({_id:ObjectId(),NEW_DATA})
```

The remove() Method

MongoDB's **remove()** method is used to remove a document from the collection. remove() method accepts two parameters. One is deletion criteria and second is justOne flag.

- **deletion criteria** – (Optional) deletion criteria according to documents will be removed.
- **justOne** – (Optional) if set to true or 1, then remove only onedocument.

Syntax

Basic syntax of **remove()** method is as follows –

```
>db.COLLECTION_NAME.remove(DELETION_CRITTERIA)
```

Example

Consider the mycol collection has the following data.

```
{"_id":ObjectId(5983548781331adf45ec5),"title":"MongoDB Overview"}
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

Following example will remove all the documents whose title is 'MongoDB Overview'.

```
>db.mycol.remove({'title':'MongoDB Overview'})
>db.mycol.find()
{"_id":ObjectId(5983548781331adf45ec6),"title":"NoSQL Overview"}
{"_id":ObjectId(5983548781331adf45ec7),"title":"Tutorials Point Overview"}
```

```
>
```

Remove Only One

If there are multiple records and you want to delete only the first record, then set **justOne** parameter in **remove()** method.

```
>db.COLLECTION_NAME.remove(DELETION_CRITERIA,1)
```

Remove All Documents

If you don't specify deletion criteria, then MongoDB will delete whole documents from the collection. **This is equivalent of SQL's truncate command.**

```
>db.mycol.remove()
```

```
>db.mycol.find()
```

```
>
```

Conclusion:

Created a Database in MongoDB and performed basic operations.

Code & Output: -

```
admin (empty)
local 0.078GB
test 0.078GB
> use Atharva
switched to db Atharva
> show dbs;
admin (empty)
local 0.078GB
test 0.078GB
>db.createCollection("Atharva")
{ "ok" : 1 }
>db.Atharva.insert("_id":1,"roll no":1,"name":kirti)
2019-10-17T23:40:48.115+0530 SyntaxError: Unexpected token :
>db.Atharva.insert("_id":1,"roll no":1,"name":"kirti")
2019-10-17T23:40:58.849+0530 SyntaxError: Unexpected token :
>db.Atharva.insert({"_id":1,"roll no":1,"name":kirti})
2019-10-17T23:41:36.538+0530 ReferenceError: kirti is not defined
>db.Atharva.insert({"_id":1,"roll no":1,"name":"kirti"})
WriteResult({ "nInserted" : 1 })
>db.Atharva.insert("_id":2,"roll no":2,"name":"aditi")
2019-10-17T23:43:08.786+0530 SyntaxError: Unexpected token :
>db.Atharva.insert({"_id":2,"roll no":2,"name":"aditi"})
WriteResult({ "nInserted" : 1 })
>db.Atharva.find().pretty()
{ "_id" : 1, "roll no" : 1, "name" : "kirti" }
{ "_id" : 2, "roll no" : 2, "name" : "aditi" }
> show dbs;
admin (empty)
local 0.078GB
Atharva 0.078GB
test 0.078GB
>db.Atharva.update({"roll no":1},{ $set:{ "name":"suraj" } })
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
>db.Atharva.find().pretty()
```

```

{ "_id" : 1, "roll no" : 1, "name" : "suraj" }
{ "_id" : 2, "roll no" : 2, "name" : "aditi" }
>db.Atharva.insert({"_id":3,"roll no":3,"name":"aditya"})
WriteResult({ "nInserted" : 1 })
>db.Atharva.find().pretty()
